DETAILED ACTION

1. Claims 1-20 are allowed.

2. The following is an examiner's statement of reasons for allowance:

The present invention provides a new method for manipulating spectral content of a pixel block for compression, in which there are no modification and additional resources needed for decoding compressed data, and no difference in the relevant portion of the image reconstructed from compression without pixel manipulation and the image reconstructed from compression with pixel manipulation because the relevant pixels are preserved (specification, page 16, line 26 - page 17, line 2).

In particular, the new method comprises the following features, which the prior art, either taken singly or in combination, does not teach:

- modifying coefficient values to generate a modified coefficient block subject to a set of pre-determined constraints including a constraint that the relevant pixels have a same value in an inverse transformation of the modified coefficient block as in the selected block (see independent claim 1);
- modifying at least one coefficient to produce a corresponding zero quantized coefficient subject to a plurality of constraints including the constraint that the coefficient is modified without being altering pixel values of an inverse transform

that correspond to nonmodifiable pixels in the selected block (see independent claim 14).
